Background:

In 2007, the Council of Ministers of Education, Canada (CMEC) issued a degree qualifications framework for assessing the quality of degree programs. This framework, entitled “*Ministerial Statement on Quality Assurance of Degree Education in Canada*,”¹ was specifically intended to provide assurance to the public, students, and postsecondary institutions that programs and institutions meet the highest quality standards and provide a context for identifying how degree credentials compare in level and standard, with a view to continuous improvement and international recognition of the quality of Canadian credentials. Furthermore, although the Conseil supérieur de l’éducation du Québec (Quebec Superior Council on Education) was in favour of the proposed framework, it stressed the importance of developing common tools that would take into account the specific character of university education in Quebec.

The CRÉPUQ² has reviewed the competency matrix included in the CMEC ministerial document.³ However, as far as we know, this competency matrix has not been adopted by its official bodies, though it may have been used by some university institutions as a source of inspiration in the development of new programs at all levels or in the periodic assessment of their current programs. However, Quebec universities have defined the basic educational goals of graduate programs in their respective academic regulations.

Consulted on May 6, 2015.

² Conférence des recteurs et des principaux des universités du Québec (Conference of Rectors and Principles of Quebec Universities), which became the Bureau de coopération interuniversitaire (Office of Interuniversity Cooperation) in January 2014.

³ See pages 3 to 8 of the *Ministerial Declaration...*, op. cit.

In 2007 and 2009, the ADÉSAQ⁴ adopted two reports discussing the nature, structure and activities associated with the master's degree at Quebec universities. The **first report** concluded that the descriptions of master's degree programs did not provide a great deal of specific information about expected competencies, and even less information about their level. The ADÉSAQ also observed that expectations in the "CRÉPUQ matrix" (in reality, the CMEC matrix) were generally high, even too high for master's degree programs, as some seemed more applicable to doctoral degree programs.

The **second report**, which provided additional explanations, recommended that institutions clearly define the expected competency levels for each specific master's degree profile, in accordance with the disciplines.⁵

At its meeting on May 20, 2011, the ADÉSAQ mandated a working group⁶ to identify the expected competencies of master's degree holders.⁷ However, the group considered it impossible to define the expected competency levels in master's degree programs without defining the competency levels in doctoral degree programs as well. Therefore, it was decided that a framework for graduate degree programs would be developed.

⁴ Association des doyens des études supérieures au Québec (Quebec Association of Graduate Deans).

⁵ Idem, page 22.

⁶ Chaired by Marie Audette of Université Laval, and made up of the following members: André Beauchesne, Université de Sherbrooke, Jean Dansereau, École Polytechnique, and Norbert Morin, UQAM; Jean Lebel, Executive Director, was invited to join the group as a researcher, analyst and editor.

⁷ Excerpt of the minutes of the ADÉSAQ meeting on May 20, 2011.

Targeted Competencies in Graduate Programs: A Common Issue for All Universities

A review of publications discussing the targeted competencies in university education programs, which is attached as an annotated bibliography in Appendix 1, provides a fair share of the answers. The members of the working group chose the competency framework of VITAE, a British group, as their source of inspiration for the design of the first framework, but consultations and work carried out at several ADÉSAQ member universities led to a version that is better adapted to the learning culture in Quebec universities. Polytechnique Montréal used this version as the basis for creating its own institutional framework for its master's and doctoral degree programs in June 2014, which includes competencies, their components and the resources to be mobilized. Due to the quality of this framework, the working group used its structure as a starting point and expanded it to include all discipline areas.

The members of the working group distinguished between research master's programs and other types of master's programs offered at Quebec universities, which are most commonly known as "professional master's programs." The true distinction between these two types of master's programs is where their students apply skills and knowledge. Research master's programs educate individuals who work in research environments or who want to pursue a doctorate, while professional master's programs educate individuals who work in practice environments in the broader sense. As for doctoral programs, the committee considered only Ph.D. programs, i.e. doctorate programs with a dissertation, while keeping in mind that the completed framework would need to take into account professionally-oriented doctorates, which are now becoming more widespread.

Added Value and Use of the Framework

This framework developed by the ADÉSAQ establishes all expected competencies⁸ of anyone who has graduated from a master's or doctoral degree program, whether these competencies are essential or complementary to their education.

In this respect, the framework provides:

- students with a tool they can use to demonstrate their professional development, thereby promoting their employability;
- professors with a tool they can use to guide their students' education and supervision, and demonstrate their students' developed competencies in various situations (references for scholarship applications or jobs);
- university institutions with a guide or a basis for developing their own framework, since this type of tool can also be used to assist their program creation and assessment process;
- certain provincial bodies, such as the Bureau de coopération interuniversitaire (Office of Interuniversity Cooperation, BCI), the Ministère (ministry), the Fonds de recherche (Research Fund), etc., with inspiration they can use to formalize their requirements in line with their specific mission.

⁸ A competency is the **potential for action** by a person (ability to act); the action in question here concerns accomplishing complex **tasks** (problem-solving, decision-making, completing projects) by mobilizing appropriate **resources** (subject knowledge and strategies) in various **situations** (<http://csrdsn.qc.ca/discas/reforme/definitionCompetence.html>. Consulted on May 6, 2015).

Framework Reading Guide

- The framework is structured as a table presenting the competencies, their components and the resources to be mobilized, i.e. knowledge, know-how (skills) and self-management (qualities) that can be developed or acquired within programs;
- In this table, the first four competencies are considered essential, i.e. minimum competencies to earn a degree, and the last competency is considered complementary to professional development and employability;⁹
- Competency components and required resources do not refer to a series of steps that must be taken or a specific hierarchy.

Colour Code Key

Knowledge area	knowledge
Know-how and intellectual skills area	skills
Self-management and personal qualities area	qualities

⁹ The ADESAQ thinks that this complementary competency is a responsibility of students, but that university institutions should provide the means necessary to develop it.

Framework of Expected Competencies

for Graduates of Master's or Doctoral Degree Programs

1. Professional and Scientific Production (*essential*)

PROFESSIONAL MASTER'S DEGREE		RESEARCH MASTER'S DEGREE		DOCTORAL DEGREE	
Competency	Competency Components	Competency	Competency Components	Competency	Competency Components
Rigorously complete the steps of a study or project in connection with the practice environment and with the support of an expert	<ol style="list-style-type: none"> 1. State the problem under study and document it based on the relevant literature. 2. Use one or more rigorous methods to analyze, assess and understand developments or professional applications. 3. Act as an agent of change and improvement in the practice environment. 4. Set a feasible schedule. 	Rigorously complete the steps of a research project¹⁰ under supervision	<ol style="list-style-type: none"> 1. State and tackle a research topic. 2. Formulate research objectives. 3. Apply and explain an appropriate research method for a project. 4. Set a feasible schedule. 5. Analyze and discuss the results in relation to a field of knowledge. 	Independently and expertly conduct a research project to make an original contribution to knowledge or scientific or technological development	<ol style="list-style-type: none"> 1. Explain a research problem supported by an exhaustive review of literature. 2. Formulate original hypotheses or research objectives based on a theoretical framework. 3. Choose, adapt or design one or more research methods or analytical approaches related to their field of research. 4. Set a feasible schedule and conduct their project accordingly, while taking constraints and unforeseen events into consideration. 5. Analyze, interpret, summarize and evaluate their own results and situate them within the scientific literature. 6. Assess the impact and the benefits of their research activities. 7. Incorporate innovation in the research approach.

¹⁰ Research design also encompasses research-creation.

2. Grande-Bretagne

2.1. Vitae: realising the potential of researchers

Vitae is the UK organisation championing the personal, professional and career development of doctoral researchers and research staff in higher education institutions and research institutes.

2.1.1. Postgraduate researcher symposium: Conversations about the doctoral experience

A report of proceedings and recommendations from the Postgraduate Researcher Symposium held at the British Library on 1 November 2011.

http://www.vitae.ac.uk/CMS/files/upload/1500-PGRSreport_2012.pdf

2.1.2. Researcher Development Framework

The Researcher Development Framework (RDF) is a major new approach to researcher development, to enhance our capacity to build the UK work force, develop world-class researchers and build our research base. The RDF is a professional development framework for planning, promoting and supporting the personal, professional and career development of researchers in higher education. It articulates the knowledge, behaviours and attributes of successful researchers and encourages them to realise their potential.

<http://www.vitae.ac.uk/CMS/files/upload/Vitae-Researcher-Development-Framework.pdf>

Selon cette analyse, le développement de la carrière de chercheur se décline en quatre domaines :

- Le domaine A : les connaissances et les capacités intellectuelles
- Le domaine B : l'efficacité personnelle
- Le domaine C : la gestion de la recherche
- Le domaine D : l'engagement, l'influence et l'impact

Chaque domaine est divisé en trois sous-domaines et l'ensemble des douze sous-domaines comprend soixante et trois descripteurs. Pour chacun d'eux, le « Researcher Development Statement » identifie les habiletés correspondant à cinq niveaux de compétence.

Cet énoncé de politique pour le développement de la carrière des chercheurs par le groupe Vitae s'applique donc à la fois à la formation à la maîtrise, au doctorat, au stage postdoctoral, ainsi qu'à la poursuite d'une carrière en recherche. Ce document identifie de façon structurée les compétences à atteindre à chacun des niveaux dans la formation des chercheurs.

2.2. The Rugby Team: Employers' views of researchers' skills - A comprehensive review of the existing literature into employers' views of the skills of early career researchers – September 2007.

3.2. École doctorale – Vie_Agro_Santé – Université de Rennes I et II

Compétences acquises

<http://www.vas.univ-rennes1.fr/fr/Sorties/CompetencesAcquises/>

Gourmandes, les entreprises ! À l'occasion d'un séminaire, elles ont dressé la liste de ce qu'elles souhaiteraient trouver chez leurs cadres. Nombre de ces compétences sont garanties à un haut niveau par le doctorat. D'autres le sont moins. Pire, le docteur (surtout formé en France) est a priori suspect d'individualisme et de déconnexion des contingences de l'activité économique. L'entretien d'embauche est souvent frustrant : trois mots au plus sur la thèse, cette Œuvre accouchée de trois années de souffrance : personne ne met en doute la formation ainsi acquise. Le gros morceau de l'entretien porte sur le reste, moins assuré par le diplôme : la communication, le leadership, l'équilibre personnel, le sens du collectif...

3.3. L'association française des docteurs : Les docteurs, des compétences sous-utilisées

<http://www.andes.asso.fr/download/fiche-competences-docteurs.html>

Alors que les besoins économiques et sociaux de transfert et d'appropriation de savoirs nouveaux augmentent, il est paradoxal de voir que les conditions d'embauche des docteurs se détériorent en France (fort chômage, faibles rémunérations et précarité des emplois). Par la pratique professionnelle de la recherche qu'il implique, le doctorat est pourtant une

formation d'excellence particulièrement adaptée pour répondre à ces demandes : de nombreux pays l'ont compris et offrent aux docteurs des perspectives de carrière nombreuses, diversifiées et rémunératrices.

3.4. La thèse en Physique : une véritable expérience professionnelle dans les métiers de la recherche

http://sfp.in2p3.fr/Debat/reforme_these/chomaz.html

Société Française de Physique
Propositions de la commission pour la réforme des thèses -
Rapport Chomaz

Ce rapport ainsi que les recommandations auxquelles il aboutit, porte uniquement sur les thèses en physique. Toutefois, nombre de remarques, conclusions et propositions peuvent être étendues à d'autres disciplines. Il a été élaboré durant une année par une commission représentative de toutes les parties prenantes, puis il a été discuté, amendé et modifié par les différentes composantes de la Société Française de Physique (conseil, bureau national, sections locales). Enfin, il a été approuvé en décembre lors du séminaire annuel des instances dirigeantes de la SFP. C'est ce texte final qui est ici présenté.

8.4 Université de Sherbrooke

Règlement des études, Annexe 1 : Finalités de formation.

« Par finalités de formation, l'Université entend des énoncés généraux qui identifient les orientations privilégiées par notre institution en termes de résultats attendus chez l'étudiante ou l'étudiant à la fin d'un cycle de formation, quel que soit le domaine de savoir ou le programme. Ces finalités doivent donc être prises en compte dans chacun des programmes d'études selon des modalités qui respectent toutefois la spécificité et les objectifs de ces programmes et aussi, dans certains cas, les exigences des ordres professionnels. Les finalités de formation se situent à un niveau plus large que les objectifs d'un programme, ces derniers précisant de façon plus spécifique et plus circonscrite les apprentissages attendus dans ce programme. » (Université de Sherbrooke, Politique-cadre sur la qualité de la formation [2500-024], p. 5.

9.2. Is a Master's Degree in Library Science a Poor Investment? A Counter Perspective to Forbes Magazine

<http://infospace.ischool.syr.edu/2012/03/07/is-a-masters-degree-in-library-science-a-poor-investment-a-counter-perspective-to-forbes>

In the June 2011 Forbes online edition, Jacquelyn Smith ranked a Master's degree in Library Sciences as the one of worst Masters Degrees a student could invest in. She based the rankings on employment projection data and average mid-career pay compared to other people in similar jobs. I can understand Smith's conclusions: based solely on statistical data, librarianship on average does make less than

engineering, mathematicians and physicists. My issue with her analysis is that statistical data alone does not provide a complete picture of the opportunities presented by obtaining a degree in librarianship. I disagree with the assertion that a degree in information sciences in an information age is a poor investment. So, let me provide a counter perspective to supplement the statistical analysis and create a more complete picture of the benefits for those considering the degree.

10.1. Training creative and collaborative knowledge-builders: A major challenge for 21st century education

François Taddei, Centre de Recherches Interdisciplinaires,
Faculté de Médecine, Université Paris Descartes

Executive summary

In a world that is changing at an unprecedented pace, what can education provide that will prepare today's children for the challenges of the Twenty-first century? This report introduces the forces that lead to rapid environmental change and the impact of a relative lag in educational reform in chapter one. In the first part of chapter two, it reviews the strategies various species including our own use to adapt to the environment: exploration, exploitation, knowledge acquisition, cooperation, information transfer, and niche-tailoring. Adaptability and exploration are key to any species that lives in changing environments, where mechanisms generating innovations are being selected. The biological metaphors described helps us to see why the importance of human creativity is growing as our environment change at an increasing pace thanks to the exponential development of science and information and communication technologies. However, education systems are evolving slower than the rest of society and traditional education is not optimally organised to promote creativity and the ability to update one's knowledge.

Hence, only the countries that implement policies to reform their education to promote adaptability and creativity in adults and children are likely to remain at the forefront of

human development and technology. Lessons from the social sciences summarised at the end of chapter two, indicate that creativity, initiative, and risk-taking should be encouraged in training today's children to become creative and cooperative knowledge-builders, i.e., able to periodically update and productively use their knowledge in their social and professional lives. Considering that student optimally develop these skills only in fostering environments, as well as the inherent difficulty in assessing creativity in millions of individual children, this report proposes focusing the creativity in education evaluation on the quality of the educational environment.

In chapter three, comparative analysis of education systems show that a huge diversity exists, interesting attempts are tried locally but only in some countries does one see national debates on the issue allowing the emergence of new education paradigms that can foster creativity. In terms of policy, chapter four proposes experimenting with new educational schemes, developing creative environments and programs, and disseminating the best educational practices within countries and across linguistic barriers by organizing a network of well-designed experiments and information exchange that is accessible to all. Recommendations addressed to different stakeholders that want to promote creativity can be found below.
